                                                                                                              The present invention describes a method (Mi) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gone (I) of a signature gene set, where (I) comprises a sequence (S) selected from 847 sequences (given in Millisto OABL/OIID), or is at least 5% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostanic activity and can be used in gene therapy. MI can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of MI, and the data is sufficient to convey the chemical structure and/or properties of the agent. MI can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, cosponageal, ovarian, kidney, prostate or pancreatic cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Screening for anti-neoplastic agent involves exposing cells chemical agent to be tested for anti-neoplastic activity, are determining a change in expression of a gene of a signature
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 1; SEQ ID 3320; 44pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC The present invention describes a method (MI) for screening for an CC anti-neoplastic agent. The method involves exposing cells to a chemical CC agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) CC comprises a sequence (S) selected from 647 sequences (given in ABLO1664 CC to ABL70110), or is at least 55% identical to (S), where a change in CC expression is indicative of anti-neoplastic activity. (I) has cytostatic contributed and can be used in gene therapy. MI can be used for screening can anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of MI, and the data is sufficient to convey the chemical currently ovarian, kidney, prostate or pancreatic cancer, continued, carcinoma, carci
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches 4268;

Screening for anti-mapplastic agent involves exposing calls to a chamical agent to be tested for anti-mapplastic activity, and determining a change in expression of a gene of a signature gene set WPI; 2002-188264/24

Claim 1; SEQ ID 6931; 44pp; English

The present invention describes a method (M1) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical agent to be fested for anti-neoplastic activity, determining a change in comprises a sequence (5) selected from 647 sequences (given in ABC1664 comprises a sequence (5) selected from 647 sequences (given in ABC1664 comprises a sequence (5) selected from 647 sequences (given in ABC1664 comprises a sequence (5) selected from 647 sequences (given in ABC1664 comprises a sequence (5) selected from 647 sequences (given in ABC1664 comprises a sequence (5) selected from 647 sequences (given in ABC1664 comprises in ABC1664 comprises in Sequences (given in ABC1664 comprises in ABC1664 comprises in Sequences (given in ABC1664 comprises in A carcinoma, papillary carcinoma and Wilm's tumour.

Sequence 4268 BP; 1199 A; 964 C; 1028 G; 1077 T; 0 other;

expression is indicative of anti-neoplastic activity. (I) has evicatantic activity and can be used in gene therapy. All can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collecte with respect to the anti-neoplastic agent as a result of M1, and the data is sufficient to convey the chemical structure and/or properties of the agent. All can be used in the treatment of concer such as colon, breast, stomach, lung, thyroid,
                                                                                                                                                The present invention describes a method (M1) for screening for an anti-neoplastic agent. The method involves exposing cells to a change in agent to be tested for anti-neoplastic activity, determining a change in agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 8447-sequences (given in ABAG1664 to ABL70110), or is at least 55% identical to (S), where a change in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 18 05

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               В
                                    The invention relates to a method for inhibiting expression of a target gene (AB191658-AB191797) in a cell by introducing at least one old old provides the standard of the consisting of at most 49 sequential nucleotide pairs, with at least one end a complementary with the target gene and has at least one end a single-strended segment of 1-4 nt. The method provides single-strended segment of 1-4 nt. The method provides described to the strended segment of 1-4 nt. The method provides described against genes present in pathogens (e.g. Plasmodium or virusss/viroids, pathogenic on humans, animals or plants) or against cycokine, id, developmental or prion genes. The method provides more effective inhibition of gene expression than use of known oligonucleotides, probably because the unpaired overhang increases

 A cunA library prepared from human cancer cell line Kato III mRNA was screened with an olsopucleotide corresponding to amino acids 529-541 of chicken basic FGF receptor. Three positive clones were obtained one was cloned into pUCIB/19 to give pTB128. The sequence of pTB1229 was the longest of the three clones. See AAQ14848 for pTB1229 winch lacks nucleotides 134-478 and 1399-1314 of pTB1229 and has an A residue in stead of a T at the position corresponding to nucleotide 1029 of pTB1229.

                                                                                                                                                                                                                                                                                                                         receptor
```

A cDNA library prepared from human cancer cell line Kato III mRNA was screened with an oligonucleotide corresponding to amino acids 529-541 of chicken basic FGF receptor. Three positive clones were obtained, one was cloned into pUCL18/119 to give pPB1228 (see AAD14848). The complete FGF coding sequence was obtained by lighting the insert from pTB1228 to the DNA sequence of the plasmid pTB1281 insert which enorghes the carboxyl terminus of the FGF receptor from Glu 533 onwards.

Example 3; Fig 8; 88pp; English.

                                                                                                                                                                    Matches
                                                                                                                                                                                                                                                                                                             The ectl sequence encoding the KGF receptor was obtd. from a clone isolated from a BALB/MK epidemal kerathocyte DNA library prepd. using the lambda pCEV37 cloning sysem of the invention. The protein appears to typical transmembranc tyrosine tyroses (see AAR10333 for details). closely related to the mouse bfGF receptor.

```

This cDNA clone comprises the nucleotide sequence encoding the fibroblast govern fattor receptor 2 (FGFR-2) isolated from the regenerating focelamb blastems of an adult Morophthainus viridacens (newt). It is part of the multigame family of FGFR involved in the The CNA condition of fibroblast growth factors (FGF) a cudic-FGF (BFGF). The CNA clone is used for producing recombinant newt aFGF, which can be used to promote growth of cultured call lines, 9, call lines used to promote growth of cultured call lines, 9, call lines used to promote growth of cultured call lines, 9, call lines are Sequence 2675 BP; 684 A; 716 C; 705 G; 570 T; 0 other; to produce other recombinant proteins, or to promote wound

Disclosure; Columns 27-32; 44pp; English. non-acidic fibroblast growth factor proteins Distinguishing between the biological activities of acidic and P-PSDB; AAY23631. WPI; 1999-418269/35

SXCCCCCCCCCCCCCXXXTTXRR (non-refer) proteins. For proteins are thought to be involved in wound healing and tissue repair. The method comparies determining and comparing the mitogenic responses of Tr31-5-1 (ATCC CRL-1521) and Tr31-1-2 (ATCC CRL-1521) and Tr31-1-2 (ATCC CRL-1521) call lines to different forms of aFCF and non-aFCF proteins. The method may be used for different tening bloogical activities among the full length form and truncated forms of aFCF proteins and other (non-aFCF) proteins. The intermethod forms of aFCF proteins and other (non-aFCF) proteins. The intermethod forms of aFCF may be used to better unders by the molecular basis of the mouthfloss. The same of aFCF are trivity in a condition of aFCF are trivity in the basis for the are triving in deal conditions. This understanding provides the basis for the are triving leasing to both lighted and AFCF are triving against a grant and after protein a grant and are triving against a grant and are triving a dealing of both lighted and AFCF are triving against a grant and are triving a dealing of the present are triving and are triving against a grant and are triving a dealing of the present are triving and are The specification describes a method for differentiating biological socilytiles among the full length form of scidic fibroblast growth factor (aFGF) proteins and other non-acidic fibroblast growth factor sequence encodes bek-like newt fibroblast growth factor receptor FGFR2

Sequence 2675 BP; 684 A; 716 C; 705 G; 570 T; 0 other;

                                                                                                                                                                                                                                        28-DEC-1990;
27-APR-1990;
31-JUL-1990;
14-SEP-1990;
was screened with an oligonuclectide corresponding to amino acids 529-541 of chicken basic PGF receptor. Three positive clones were obtained. One was cloned into pUC118/119 to give pTB1228. The sequence of pTB1228 is shorter than that of pTB129 lacking nucleotides 134-478 and 1309-1314 (see AAQ14849).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         2463
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              2688

This cDNA clone comprises the nucleotide sequence encoding the Keratinodyle growth factor receptor (KGPR) isoform isolated from the regenerating forelimb blastems of an adult Motophthalmus viridscens (newt). It is fibroblast growth factor (FGF) related with properties of a paracine effector of epithelial cell growth. The properties of a paracine effector of epithelial cell growth can be used for producing recombinant new aFGF, which can be used to promote growth of cultured cell lines, e.g. cell lines used to produce other recombinant proteins, or to promote wound best of the produce other recombinant proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A cDNA clone, useful for producing recombinant protein - comprises
